

Fireloop® Installation Instructions:

1. Fireloop® can be connected to adjacent piping with rigid or flexible type couplings.
2. A Metraflex Fireloop® may be installed in any orientation / position.*
3. Fireloop® support:
 - a. No support is required for the (180°) return bend for Fireloops® 2 inch or smaller.
 - b. Support for the (180°) return bend for Fireloops® 2½” and larger. Fireloops® hanging down require no support. Support for other orientations can be provided in two ways;
 - i. A hanger rod at the 180 that is 12” long or *greater*, for the +/- 4” of movement Fireloops® will allow the loop to swing and no additional steps are necessary. For +/- 8” of movement Fireloops® the hanger rod should be 16” long or *greater*.
 - ii. If the Fireloop® is installed with hanger rods less than distances recommended above, a Breakaway Coupling (BAC) is recommended, to allow the Fireloop® to flex during seismic event.
4. Fireloops® are shipped with the shipping bar to insure a neutral face to face during installation. This shipping bar must remain in place during installation, but then must be removed prior to testing.
5. Clearance: Fireloops® designed for:
 - a. +/- 4” of movement, must have 4” of clearance all around the Fireloop®
 - b. +/- 8” of movement, must have 8” of clearance all around the Fireloop®
 - c. +/- 24” of movement, must have 24” of clearance all around the Fireloop®

Metraflex[®]

for pipes in motion

6. If the Fireloop cannot span the building's seismic separation, it may be installed with the closest elbow not more than 24 inches from the seismic separation.

* When Fireloop is installed in the up (180 bend above pipe run) position consideration should be given to the removal of entrapped air.
